SUMMARY

Backend engineer focused on **scalability** and **data integrity** (validation, idempotency, safe retries)
Built and owned reliable backend systems, APIs, and data pipelines in **Node.js**, **Golang**, and **Python**
Skilled in **agentic AI systems**: multi-agent orchestration, tool calling, and LLM-integrated workflows

WORK EXPERIENCE

LCX | Software Development Engineer — Gurugram, IN | Aug 2022 - Mar 2026

- Led the backend development of Tiamonds (now TotoFinance), an NFT marketplace. Owned the backend end to end: scoping requirements, estimating timelines, API design, implementation, and deployment.
- Built **concurrency-aware REST APIs** and **asynchronous pipelines** in Node.js
- Refactored backend code and optimized database queries; **cut process memory consumption by 50%** (130 MB to 65 MB)
- Researched and implemented **server-signed message flows** for ERC-721 marketplace operations to reduce on-chain overhead (**cut gas costs by approximately 50%**) and to enable efficient workflows for new features
- Built an **ETL pipeline (Python, Pandas)** that syncs approximately 80,000 CSV rows into MongoDB for over 20,000 assets
- Built **retry-safe blockchain monitoring services** to synchronize and update the database based on blockchain events

Independent Software Engineer — Mar 2026 - Present

- Built **multi-agent pipeline** using LangGraph, integrating LLM tool calling and LangSmith tracing
- Implemented microservices isolation patterns, focusing on data consistency under concurrency and retries

SKILLS

Core Backend: JavaScript, TypeScript, Node.js, Golang, Python, Express.js, SQL, REST APIs, gRPC, MySQL, MongoDB, PostgreSQL, Redis, Kafka, BullMQ, Microservices

DevOps & Infra: Git, Linux, CI/CD (GitHub Actions), AWS (EC2, S3), Docker, Kubernetes, Nginx, systemd, PM2

LLM & AI Tools: Agentic AI, LLM orchestration, LangChain, LangGraph, LangSmith, Local AI (Ollama, Qwen)

Fundamentals: Data Structures and Algorithms, System Design

EDUCATION

B. Tech. Computer Science and Engineering — JH, IN | 2022
BIT Sindri | 9.24 CGPA

PROJECTS

PAYMENT MICROSERVICES APP — TypeScript, Node.js, MySQL, gRPC, Kafka, Kubernetes

- Payment system built as **containerized microservices**, deployed on a Kubernetes cluster
- Safe money transfers under concurrency and retries via **idempotency keys**, **atomic conditional balance updates**, **transactional database updates**, and **fixed row-lock ordering** to avoid deadlocks
- Asynchronous, fault-tolerant event delivery via **Kafka** (transactional outbox pattern), and typed service-to-service calls via **gRPC** (Protobuf)
- Unit and integration tests (**Vitest**, **Testcontainers**) with **CI** on **GitHub Actions** for per-service test and build

CODEBASE-AWARE PR REVIEW AGENT — TypeScript, Node.js, LangGraph, BullMQ, Redis, MySQL, Docker

- **Event-driven GitHub App** that reviews pull requests with a **multi-agent pipeline** and posts one findings comment per PR
- **Reliable webhook processing**: signature verification, **idempotency** by GitHub delivery ID, **BullMQ** queue with retries
- Specialized **security**, **quality**, and **tests** agents with codebase tools (read file, search code) and a **swappable LLM provider** (Anthropic, OpenAI, Gemini, OpenRouter, Ollama), with **LangSmith** tracing and per-step token/latency tracking
- **CI/CD on GitHub Actions**: unit and Testcontainers integration tests, **approval-gated deployment** to a Linux server

COMMUNITY CONTRIBUTIONS

- Open-source contributions (**MeshJS**, TypeScript): refactored transaction metadata handling and fixed metadata-loss bug (PR 416); fixed HD wallet account bug (PR 396)
- Technical articles, available on **Medium**: @dharmveerbharti
